

Make It Do Something

Week 8, Task 1: One live feature, end to end

THE ONE FEATURE

Ask about my work, a small AI question and answer widget placed right below the hero section, before the project cases.

A visitor types a question about my experience or projects, and gets a real, live generated answer grounded in my actual work, not a static FAQ.

STACK, BOTH ON A FREE TIER

Vercel, hosting a small serverless function (`api/ask.js`) that receives the question and keeps the API key private.

Groq, the AI provider that generates the actual answer, called from inside that function.

LIVE EVIDENCE, A REAL TEST QUESTION

ASK ABOUT MY WORK

Which is the most powerful project that arthur made?

Ask

Arthur has showcased a variety of projects on his site, but one of his notable works is the custom Power BI non-conformity dashboard for CSI Filtros. He designed this dashboard with filters by origin and year, along with cost analysis views, which suggests the power and complexity of the project lies in its data visualization capabilities and analytical depth.

Real question asked on the live site, answered live by the deployed feature, no placeholder or canned response.

PLAIN WORDS EXPLAINER

What a backend is

Backend is the part of a system that runs behind the scenes, usually responsible for things like security and communication with databases. The main pieces are APIs, servers, and databases.

What the feature does

The feature receives a question about my portfolio and answers the visitor as clearly and objectively as possible, so they learn more about my career and background.

How the data flows

1. The user clicks "Ask." This runs directly in the browser.
2. The JavaScript takes that question and sends it to my own function, at `davino-ask-api.vercel.app/api/ask`.

3. That request runs on a Vercel server, never on a personal computer.
4. The function calls the AI provider, Groq, to actually generate the answer.
5. The response from Groq reaches the Vercel server, which sends it back to the fetch running in the browser's JavaScript.
6. The JavaScript writes the text on the screen, inside the `<p id="ask-answer">` element.
