

Survive the Crit

Week 7, Task 2: Design review, must-fix vs nice-to-have

PROOF STATEMENT SUBMITTED FOR REVIEW

"I research before I build, so what I ship actually works."

This is the version of the proof statement that was live on the site at the time of the review, submitted along with the live portfolio URL to a real reviewer for a structured critique.

REVIEWER

A real person outside the FlyRank track, asked to give a genuinely critical read rather than a friendly one. She had reviewed an earlier version of the site before, but this review was a new, more structured pass.

THE TWO OPENING QUESTIONS

Q1: In ten seconds, with your own words, what do I do professionally?

"He handles the administration of some company, because of the charts and the problem solving."

Q2: Just from looking at the site, would you believe I am good at it?

"Yes, because it is well explained how each method you added to the site works."

REST OF THE FEEDBACK

Liked: the separation between the two projects, the font, the photo and self introduction, and the color palette.

Suggestion: an eye catching image above the name, at the very top of the hero, matching what the site wants to communicate to a first time visitor.

SORT: MUST-FIX VS NICE-TO-HAVE

MUST-FIX

Professional identity is not landing on a quick scan

The site states "Data Science student, AI Intern at FlyRank AI" directly under the name, but the reviewer still answered with "administration of a company", reasoning from the charts and problem solving language in the case studies rather than the role line itself. This hits the core pass criterion directly: the reviewer could not state what the member does.

NICE-TO-HAVE

Eye catching image above the name

The reviewer framed this herself as an enhancement ("would be a nice extra"), not as something confusing or broken. Proof statement still landed (question 2 passed), so this stays out of scope for this checkpoint and is parked for later.

MUST-FIX ADDRESSED

Fixed on two fronts at once: made the role line visually stronger, and rewrote the opening statement to name the domain directly, so the identity survives a quick scan even if the role line itself gets skimmed past.

BEFORE

```
.hero p.role {  
  color: var(--accent);  
  font-weight: 500;  
  margin: 0 0 24px;  
}
```

AFTER

```
.hero p.role {  
  color: var(--accent);  
  font-weight: 600;  
  font-size: 17px;  
  letter-spacing: 0.2px;  
  margin: 0 0 24px;  
}
```

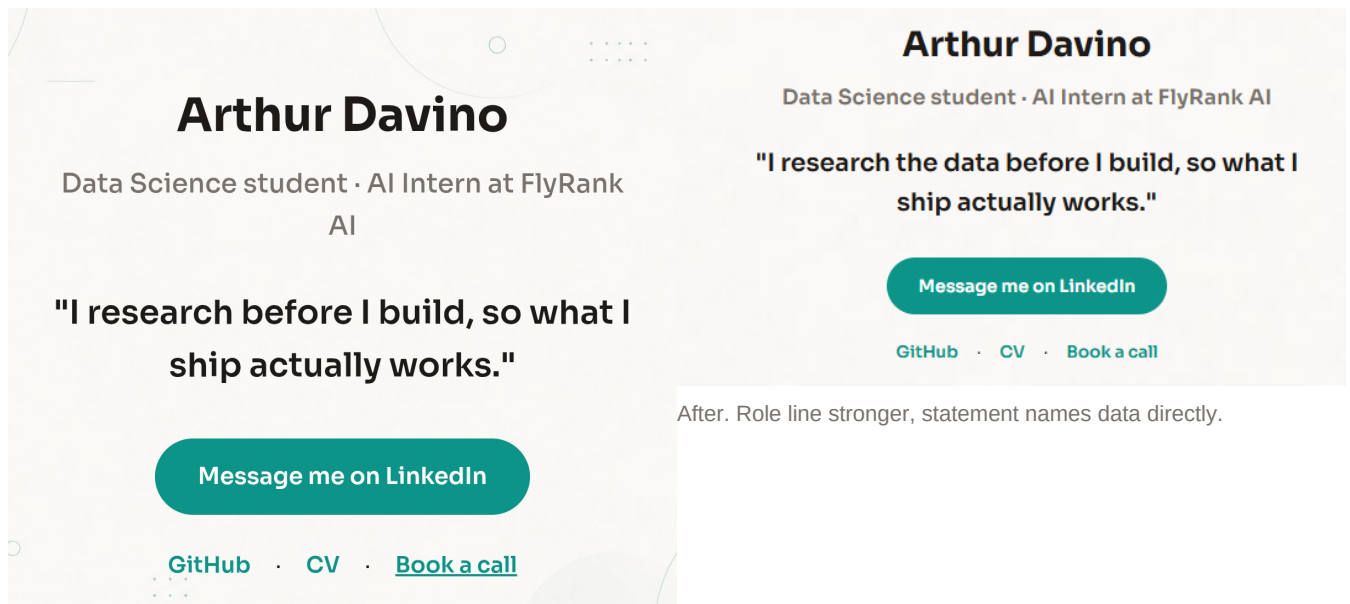

BEFORE

"I research before I build,
so what I ship actually works."

AFTER

"I research the data before
I build, so what I ship
actually works."

CONFIRMED LIVE

After. Role line stronger, statement names data directly.

Before. Role line easy to skim past, statement is domain-neutral.

Change committed directly to the main branch (commit 4ba7341) and verified live on arthurdavino.github.io, not just acknowledged.

ENGAGEMENT NOTE

The must-fix answer (administration of a company) was taken at face value rather than argued against, even though the site technically already stated the role in text. The gap between what was written and what was understood was treated as the real finding, and fixed on the site instead of explained away in conversation.
